IN THE CLAIMS

- (Currently Amended) A method of communication comprising:
 <u>in response to a request for a service</u>, transmitting at least one message comprising
 <u>existing</u> delay information corresponding with a <u>an estimated</u> delay length associated
 with accessing a <u>the</u> service though an open loop network.
- 2. (Currently Amended) The method of Claim 1, wherein the <u>estimated</u> delay length comprises at least one time interval between a first instant corresponding with a received service request and a second instant corresponding with granting service access.
- 3. (Currently Amended) The method of Claim 1, wherein the <u>estimated</u> delay length comprises at least one time interval between a first instant corresponding with a received autonomous service request generated at a predefined moment in time and a second instant corresponding with granting service access.
- 4. (Original) The method of Claim 3, wherein the predefined moment in time comprises at least one of a periodic and an aperiodic instant.
- 5. (Currently Amended) The method of Claim 1, wherein the <u>estimated</u> delay length corresponds with at least one of traffic congestion, channel condition, system loading, processor occupancy, queuing delay, and scheduler delay.
- 6. (Original) The method of Claim 1, wherein the open loop network comprises at least one of a wireline network and a wireless network.

- (Original) The method of Claim 6, comprising:
 collecting information corresponding with at least one parameter associated with service access.
- 8. (Original) The method of Claim 7, comprising:determining at least one pattern associated with the at least one parameter.
- 9. (Original) The method of Claim 8, wherein the at least one parameter comprises at least one of traffic, channel condition, and service demand.
- 10. (Currently Amended) A method of communication comprising:

 <u>in response to a request for a service</u>, receiving at least one message comprising <u>existing</u>
 delay information corresponding with <u>a an estimated</u> delay length associated with
 accessing <u>a the</u> service through an open loop network.
- 11. (Currently Amended) The method of Claim 10, wherein the <u>estimated</u> delay length comprises at least one time interval between a first instant corresponding with generating a service request and a second instant corresponding with receiving a service access grant.
- 12. (Currently Amended) The method of Claim 10, wherein the <u>estimated</u> delay length comprises at least one time interval between a first instant corresponding with an autonomous service request generated at a predefined moment in time and a second instant corresponding with granting service access.
- 13. (Original) The method of Claim 12, wherein the predefined moment in time comprises at least one of a periodic and an aperiodic instant.

- 14. (Currently Amended) The method of Claim 10, wherein the <u>estimated</u> delay length corresponds with at least one of traffic congestion, channel condition, system loading, processor occupancy, queuing delay, and scheduler delay.
- 15. (Original) The method of Claim 10, wherein the open loop network comprises at least one of a wireline network and a wireless network.
- 16. (Original) The method of Claim 15, comprising: generating information corresponding with at least one parameter associated with service access.
- 17. (Original) The method of Claim 16, wherein the at least one parameter comprises at least one of traffic, channel condition and service demand.
